The invention relates to human CD20/immunoglobulin E (IgE) receptor like polypeptides designated as agp-96614-al and agp-69406-al and nucleic acid molecules encoding such polypeptides. Polypeptides of the invention are useful for treating, preventing or ameliorating a disease, condition, or disorder which includes cancer such as brain cancer; abnormal cell proliferation such as arteumatoria arthritis, advormal cell proliferation such as arteumatoria arthritis, auchamine disease, multiple sclerosis, such as arteumatoria arthritis, auchamine diseases, multiple sclerosis, diabetes, transplant rejection and reproductive diseases such as infertility, preterm labour and delivery, endometriosis etc. They are also useful for identifying antagonists and as immunogens, for raising antibodies which may also be used to prevent, treat or calsances and diseases and disorders. Polynucleotides of the invention are used to map the location of CD20/IGE-receptor like gene and related genes on chromosomes and as hybridisation probes. They are also useful in gene therapy. The present sequence is human CD20/IGE-receptor like protein, agp-96614-al.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TFSFGVIFLFTLLKPYPRFPFIFLSGYPFWGSVLFINSGAFLIAVKRKTTETLIILSRIM 120

potentially secreted proteins. The nucleic acids and the polypeptides they encode may be used in the prevention, treatment and diagnosis of they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GENGET gene expression. For example, they be used to treat disorders associated with decreased GENGET gene expression by rectifying mutations or deletions in a patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisense nucleic acid molecules may be administered to down regulate GENSET expression by binding with the cells' own genes and preventing their expression. The sense and antisense nucleic acids may also be presence of similar nucleic acid sequences in samples, and hence to determine which patients may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and ansays to identify modulators (agonists and ansays to identify modulators (agonists) of GENSET polypeptide expression and activity. The present sequence is a GENSET polypeptide of the invention.
                                                                                                                                                 Full length GENSET human nucleic acids encoding potentially secreted proteins, useful in gene therapy and vaccination against a variety of diseases, and for diagnosis of those diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             121 NFLSALGAIAGIILLTFGFILDQNYICGYSHQNSQCKAVTVLFLGILITLMTFSIIELFI 180

                                                                                                                                                                                                                                                                                                                                                   Human membrane protein #1 is 1 of 4 human membrane proteins (AAMO1210-AAMO1213) given in the present invention. These membrane proteins share structural similarity with membrane receptors such as the 1gr receptor and mammalian CD20. The novel human membrane proteins are useful for identifying agonists, antagonists and modulators of the membrane proteins, and for producing antibodies specific to the membrane proteins. The membrane proteins can be used for diagnosis, and the treatment of physiological disorders and diseases. The polynucleotides encoding the membrane proteins can be used for diagnosis, polynucleotides encoding the membrane proteins can be used to generate polynucleotides encoding the membrane proteins can be used to generate profession or probes to identify mutations associated with a particular

                                                                                                                                                                                                                                                                   DNA. Human immune-system related protein and DNA are useful for preventing, treating or ameliorating a medical condition in a mammalian subject, for diagnosing, preventing or treating immune system-associated disorders, autoimmune disorders (rheumatoid arthritis), inflammatory disorders (allergies), immunodeficiencies (AIDS), inflammatory disorders (allergies), infectious diseases (e.g., viral hepatitis), complement activation disorders, immune complex diseases, neoplastic disorders (cancer), hyperproliferative disorders (Gaucher's disease), disorders cardiovascular disorders (arthritis), wound healing and epithelial cell proliferation, endocrine disorders (diabetes mellitus) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          neurological disorders (ischaemic lesions). Immune-system related protein or DNA is useful for preventing hair loss, skin aging due to sunburn, to maintain organs before transplantation, to treat weight disorders, to modulate mammalian characteristics, to change a mammal's mental or physical state, or as a food additive or preservative. Immune-system related DNA is useful in gene therapy, for chromosome identification, radiation hybrid mapping, long range restriction mapping and in forensic biolog. The present sequence represents a human immune-system related protein of the invention.

Human membrane protein #4 is 1 of 4 human membrane proteins the protein membrane protein in the present invention. These membrane proteins share structural similarity with membrane receptors such as the igs receptor and mammalian CD20. The novel human membrane proteins are useful for identifying agonists, antagonists and medulators of the membrane proteins and proteins are useful for producing antibodies specific to the membrane proteins. The membrane proteins can be used for diagnosis, drug screening, pharmacogenomic applications, clinical trial monitoring and the treatment of physiological disorders and diseases. The polynucleotides encoding the membrane proteins can be used to generate per proteins or probes to identify mutations associated with a particular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 TFSFGVIFLFTLLKPYPRFPFIFLSGYPFWGSVLFINSGAFLIAVKRKTTETLIILSRIM 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition

Tang YT, Liu C, Drmanac RT;

WPI; 2001-457740/49. N-PSDB; ABA09478. Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammallan subject e.g. arthritis and cancer -

Claim 20; Page 318; 1963pp; English.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABB10981-ABB12330 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the larvention, methods of producing the novel polypeptides, and hence polypeptides, methods of detecting the nucleotides, cor polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention have homology to known proteins, thereby of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may differentiation activities; stem for activity; state growth activity; differentiation activities; stem for activity; the propable activities; haematopoiesis regulatory activity; tissue growth activity; chanced activities; heamatopoiesis receptor or inhibin-related activities; chemotatic or chemokinetic activities; haemostatic, thrombotic or thrombolytic activities; receptor or inhibin-related activities; chemotactic or chemokinetic activities; haemostatic, and nucleotides of the invention are useful for preventing, treating or metastasis.

Conditions, e.g., by protein or gene therapy, Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), arterial ischaemia, bone disorders (e.g., myeloid or lymphoid cell disorders, carcers, haematopoletic disorders (e.g., myeloid or lymphoid cell disorders (e.g., myeloid or lymphoid cell cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell disorders (e.g., myeloid or lymphoid cell cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell disorders (e.g., myeloid or lymphoid cell cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell ceptor or setting or gene therapy. Such conditions (e.g., by broaden or gene therapy such myeloid or lymphoid or

ö Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides screening techniques. The present sequence represents a novel human polypeptide of the invention. The present sequence represents novel human membrane protein #3. Human membrane protein #3. Human membrane proteins #3 is 1 of 4 human membrane proteins (AAU01210-AAU01213) given in the present invention. These membrane proteins share structural similarity with membrane receptors such as the 1gE receptor and mammalian CD20. The novel human membrane proteins are useful for identifying agonists, antagonists and modulators of the membrane proteins, and for producing antibodies specific to the Gaps 1 MDSSTAHSPVFLVFPPEITASEYESTELSATTFSTQSPLQKLFARKMKILGTIQILFGIM 60 Polynucleotide encoding novel human membrane protein, useful for identifying agonist, antagonist or modifiers or for producing antibodies useful in therapeutic, diagnostic and pharmacogenomic ö Human; membrane protein; membrane receptor; IgE receptor; CD20; Length 158; 1; Indels DB 22; Score 687; DB 22 Pred. and the treatment of physiological disorders and diseases. The polynucleotides encoding the membrane proteins can be used to generate PCR primers or probes to identify mutations associated with a particular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' unts is rarely included. 5' ESTs are derived from mRNAs with intext 5' UTR is rarely procedure be used to obtain full length cDNAs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                         New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                ö

                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to full length GENSET human nucleic acids encoding potentially secreted proteins. The nucleic acids and the polypeptides they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GENSET gene expression. For example, they be used to treat disorders associated with decreased GENSET gene expression pretifying mutations or deletions in a patient's genome that affect the activity of GENSET or by supplementing the patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisanse nucleic acid molecules may be administered to down regulate their expression. The sense and antisense nucleic acids mutations or detect and quantitate the used as DNA probes in diagnostic assays to detect and quantitate the determine which patients may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antisanse to detect and activity. The candonists) of GENSET polypeptide expression and activity. The present sequence is a GENSET polypeptide expression and activity. The

The present sequence was first identified in Incyte clone 927955 for the brain cDNA library BRAINOTO4. POLYNUCleotides complementary to the IGERB CONA can be used as probes to IGERB gene expression. IGERB proteins and nucleotides may be used for the diagnosis of inflammatory responses associated with expression of IGERB, e.g. AIDS, Addisons's disease, atherosclerosis, bronchitis, ulcerative colitis, diabetes mellitus, emphysema, gout, Garves's disease, osteoporosis, rheumatoid arthritis, Sjogren's syndrome and complications of cancer. The sequences may also be useful in assays that detect activation or

consensus. An allergic response is initiated by release of IgE from B Lymphocytes. The IgE molecules then bind to the high affinity (from B Lymphocytes. The IgE molecules then bind to the high affinity concludes of histamine and proteases from cytoplasmic granules and the release of histamine and proteases from cytoplasmic granules and cade to the synthesis of effectors of the allergic and inflammatory leads to the synthesis of effectors of the allergic and inflammatory concepts. It may be administered to stimulate allergic and inflammatory and inflammatory and inflammatory and inflammatory and allergic and inflammatory and antipodies and to identify concepts and antagonists of IGERB expression and activity. The antibodies may also be used in diagnosis. Antibodies and antagonists may be administered to downregulate IGERB activity and reduce the potency of inflammatory and allergic responses. They may be used in this way to treat inflammatory disorders such as multiple sclerosis, cateoarthritis, asthma and some complications of cancer. Conversely, the gonists may be used to enhance immune responses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ğ
                                                                                                                                                                                                                                                                                           ANY9489 to AAY94980, isolated from human settled process. Since AAY94989 to AAY94980, isolated from human adult brain, adult thyroid, adult retina, foetal carcinoma, adult blood, adult neural, foetal kidney, adult placenta, adult testis, whole embryo, adult cartilage, kidney, foetal brain, adult thymus, foetal placenta, adult uterus, adult tumour, and adult bladder, cDNA libraries. The polynucleotides and proteins are predicted to have blological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. The polynucleotides can be used as markers for tissues in which the protein is preferentially expressed, as molecular weight markers on Southern gels, and as Chromosome markers or to map gene posticions. The proteins can be used in the treatment of immune deficiencies and disorders, such as severe combined immunedeficiency (SCID), as well as viral, bacterial, fungal and other infections. These infections include human immunodeficiency virus (HIV), hepatitis, herpesviruses, mycobacteria, Leisamania spp., malaria and candidasis. The proteins can be lused to treat autoimmune disorders such as connective tissue disease, multiple sclerosis, systemic lupus crythematosis, rheumatoid arthritis, leisamania spp., malaria and candidasis, rheumatoid arthritis, autoimmune pulmonary inflammation, cullialah-Barre syndrome, autoimmune theory or probes for the human secreted proteins can also be used to treat allergic conditions, such asthma. AAA16698 to AAA16774 represent proteins.

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been clones. 830 cDNA molecules sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Finances for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA assity without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Primers useful for synthesizing full length cDNA clones and their in genetic manipulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             98 SGAFLIAVKRKTTETLIILSRIMNFLSALGAIAGIILLTF--GFILDQNYICGYSHQNSQ 155

Patent No. 5705615
GENERAL INPORMATION:
APPLICANT: Lim, Bing
APPLICANT: Adra, Chaker N.
APPLICANT: Lelias, Jean-Wichel
TITLE OF INVENTION: RECOMBINANT HTM4 GENE, PROTEIN AND
TITLE OF INVENTION: ASSAYS
NUMBER OF SEQUENCES: 4
     PatentIn Release #1.0, Version #1.25
                      CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/318,492
FILIND DATE:
CLASSIFICATION: 530
ATTORNEY/AGENT INFORMATION:
NAME: BROOK, DAVId E.
REGISTRATION NUMBER: 22,592
REFERENCE/DOCKET NUMBER: BIH94-03
TELECOMMUNICATION INFORMATION:
SEQUENCE CHARACTERISTICS:
LENGTH: 1661 base pairs
TYPE: NUCLELC acid
TYPE: NUCLELC acid
                                                                                                                                                                                                                                                                                                                                                                                                                           TOPOLOGY: linear
MOLECULE TYPE: DNA (genomic)

Application US/08184632

Sequence 1. Application US/08184632

Patent No. 5646009

GENERAL INFORMATION:
PAPLICANT: RHOADS, ROBERT E
APPLICANT: RHOADS, ROBERT E
TITLE OF INVENTION: HYBRID VECTOR AND METHOD RESULTING IN
TITLE OF INVENTION: PROTEIN OVERPRODUCTION BY EUKARYOTIC CELLS
NUMBER OF SEQUENCES: 1
CORRESPONDENCE ADDRESS: 1
ADDRESSEE: Lowe, Price, LeBlanc & Becker
STREET: 99 Canal Center Plaza, Suite 300
CITY: Alexandria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DB 2; Length 3889;

Patent No. 5907081
GENERAL INFORMATION
APPLICANT: Isaac, Peter G.
APPLICANT: Roberts, Jeremy A.
APPLICANT: Coupe, Simon A.
TITLE OF INVENTION: Control of Plant Abscission and Pod Dehiscence
NUMBER OF SEQUENCES: 7
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 39.2; DB 2; Length 2447;

CC the invention relates to human CD20/immunoglobulin E (IGE)-receptor cC ulcle polypeptides designated as agp-96614-al and agp-6446-al and nuclei acid molecules encoding such polypeptides. Polypeptides of the invention are useful for treating, preventing or ameliorating attentiosclerosis, vascular restenosis; pathology from allergens cC arteriosclerosis, vascular restenosis; pathology from allergens such as sheumatoid arthritis, autoimmune disease, multiple sclerosis, diabetes, transplant rejection and reproductive diseases such as conferentially, preterm labour and delivery, endometriosis etc. They are also useful for identifying antegonists and as immunogens, for raising antibodies which may also be used to prevent, treat or raising antibodies which may also be used to prevent, treat or raising antibodies which may also be used to prevent, treat or raising antibodies which may also be used to prevent, treat or raising antibodies which may also be used to prevent, treat or raising antibodies which may also be used to prevent, treat or raising antibodies which may also be used to prevent, treat or raising antibodies which may also be used to prevent, treat or raising antibodies of the provent of diseases and as phybridistation probes.

CC They are also useful in gene therapy. The present sequence is human CD20/IgE-receptor like protein encoding CDN, age-respector is human CD20/IgE-receptor like protein encoding CDN, age-respector like protein encoding CDN, age-respector like protein encoding

potentially secreted proteins. The nucleic acids and the polypeptides diseases associated with inappropriate GRNSET gene expression. For example, they be used in the prevention, treatment and diagnosis of GENSET gene expression. For example, they be used to treat disorders associated with decreased GENSET gene expression by rectifying mutations or deletions in a patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisense nucleic acid molecules may be administered to down regulate GENSET expression by binding with the cells' own genes and preventing their expression. The sense and antisense nucleic acids may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence to determine which patients may be in need of restorative therapy.
                                                                                                                      099

Human immune-system related protein and DNA are useful for DNA. Human immune-system related protein and DNA are useful for DNA. Human immune-system related protein and DNA are useful for DNA. Human immune-system-associated disorders, autoimmune disorders (theumatoid arthritis), inflammatory disorders (allergies), infectious diseases (e.g., viral hepatitis), complement activation disorders, immune complex diseases, neoplastic disorders (cancer), hyperproliferative disorders (Gaucher's disease), disorders (cancer), hyperproliferative disorders (Gaucher's disease), disorders (cancer), hyperproliferative disorders (Gaucher's disease), disorders (cancer), hyperproliferation, disorders (diabetes melling and epithelial cell proliferation, endocrine disorders (diabetes mellitus) and cell proliferation, endocrine disorders (diabetes mellitus) and cell proliferation, endocrine disorders (standarios). Immune-system related protein cor DNA is useful for preventing hair loss, skin aging due to sunburn, to maintain organs before transplantation, to treat weight disorders, to modulate mammalain characteristics, to change a mammal's mental or physical state, or as a food additive or preservative. Immune-system related DNA is useful in gene therapy, for chromosome identification, cradiation hybrid mapping, long restriction mapping and in forensic

                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                           The present sequence encoding for a novel human membrane protein includes the flanking 5'- and 3'- sequences. Four amino acid sequences for novel human membrane proteins (AMO1210-AMO1213) are given in the present invention. These membrane proteins abare structural similarity with membrane receptors such as the IgE receptor and mammalian CD20. The novel human membrane proteins are useful for identifying agonist, antagonist and modulators of the membrane proteins, and for producing antibodies specific to the membrane proteins. The membrane proteins can be used for diagnosia, drug screening, pharmacogenomic applications, and diseases. The polynucleosides encoding the membrane proteins can be used to generate PCR primers or probes to identify mutations associated

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cytostatic; osteopathic; vasotropic; cardiant; virucide; antibacterial; antifungal; vulnerary; antiulcer; ss.

collypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutica applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differentiation activities, including cytokine, cell proliferation or cell differentiation activity; activin- or inhibin-related activities; had man activity; insue growth activity; insue growth activity; insue growth activities; comparation or chemotric or chemokinetic activities; receptor or ligand activities; or may be involved in oncogenesis, cancer cell proliferation or metastasis.

CC thrombolytic activities; receptor or ligand activities; or may be involved in oncogenesis, cancer cell proliferation or metastasis.

CC beending on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell disorders, bone disorders (e.g., myeloid or lymphoid cell cancers, haematopoietic disorders (e.g., osteoporosis), and abnormal vascular growth. Polypeptides involved with tissue regeneration and vascular growth. Polypeptides may be used to promote wound healing (e.g., of burns, incisions and ulcers), while those with chaling (e.g., of burns, incisions and ulcers), while those with growth factor activity may be used to promote cell growth. For example, such polypeptides may be used to commote burned to promote cell growth. For example, such polypeptides may be used to commote the planter of require to growth properties of require to neuroepithalial cells and the planter of required to mental cancer of any properties of required to receive the mells of required to receive the cells and the planter of required to remore planterial and control or repetited to remore planterial and properties and or required to remore planterial cance autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug The present sequence represents a cDNA encoding a polypeptides of the invention. Although novel, many of the can be used to augment or replace cells damaged by illness, novel human polypeptide of the invention. techniques. screening that

The present sequence encodes for novel human membrane protein #1. Human membrane proteins #1 so f 4 human membrane proteins (AADU1210-AADU1213) given in the present invention. These membrane proteins share structural similarity with membrane receptors such as the IgE receptor and mammalian CD20. The novel human membrane proteins are useful for identifying agonists, antagonists and modulators of the membrane proteins, and for producing antibodies specific to the membrane proteins. The membrane proteins can be used for diagnosis, and the treatment of physiological disorders and diseases. The polynucleotides encoding the membrane proteins can be used to generate polynucleotides encoding the membrane proteins can be used to generate profession or probes to identify mutations associated with a particular Polynucleotide encoding novel human membrane protein, useful for identifying agonist, antagonist or modifiers or for producing antibodies useful in therapeutic, diagnostic and pharmacogenomic Human; membrane protein; membrane receptor; IgE receptor; CD20; physiological disorder; ss. /*tag= a

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain processin regulatory sequences and to design expression and secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                264

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence encodes for novel human membrane protein #4. Human membrane protein #4 is 1 of 4 human membrane proteins fAMO1210-AMO1213 given in the present invention. These membrane proteins share structural similarity with membrane receptors such as the IgE receptor and mammalian CD20. The novel human membrane proteins mer useful for identifying agonists, antagonists and modulators of the membrane proteins. The membrane proteins are useful for identifying agonists, antagonists and modulators of the membrane proteins. The membrane proteins can be used for diagnosis, and screening, pharmacogenomic applications, clinical trial monitoring and the treatment of physiological disorders and diseases. The polynucleotides encoding the membrane proteins can be used to generate por primers or probes to identify mutations associated with a particular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            aaattatttgctagaaaaatgaaaatcttagggactatccagatcctgtttggaattatg 277

Human membrane protein #3 is 1 of 4 human membrane proteins fAMO121019 given in the present invention. These membrane proteins share structural similarity with membrane receptors such as the IgE receptor and mammalian CD20. The novel human membrane proteins are useful for identifying agonists, antagonists and modulators of the membrane proteins. The membrane proteins are useful for identifying agonists, antagonists and modulators of the membrane proteins. The membrane proteins can be used for diagnosis, drug screening, pharmacogenomic applications, clinical trial monitoring and the treatment of physiological disorders and diseases. The polynucleotides encoding the membrane proteins can be used to generate per primers or probes to identify mutations associated with a particular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
Polynucleotide encoding novel human membrane protein, useful for identifying agonist, antagonist or modifiers or for producing antibodies useful in therapeutic, diagnostic and pharmacogenomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; membrane protein; membrane receptor; IgE receptor; CD20; physiological disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             44.8%; Score 340.2; DB 22; Length 417;

Human membrane protein #2 is 1 of 4 human membrane proteins (AAUO1210-AAUO1213) given in the present invention. These membrane proteins share structural similarity with membrane receptors such as the IgE receptor and mammalian CD20. The novel human membrane proteins

The invention relates to full length GENSET human nucleic acids encoding potentially secreted proteins. The nucleic acids and the polypeptides they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GENSET gene expression. For example, they be used to treat disorders associated with decreased GENSET gene expression. For example, they be used to treat disorders associated with decreased GENSET gene expression by rectifying mutations or deletions in a patient's genome that affect the activity of GENSET or by supplementing the patients own production of GENSET polypeptides. Conversely, antisense nucleic acid molecules may be administered to down regulate atteins rexpression. The sense and antisense nucleic acids may also be their expression. The sense and antisense nucleic acids may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence to determine which patients may be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antibodies and in assays to identify modulators (agonists and antibodies and sequence is a GENSET polypeptide expression and activity. The present sequence is a GENSET nucleic acid of the invention.

AAA16618 to AAA16697 encode the human secreted proteins given in AAY94898 to AAY94980, isolated from human adult brain, adult thyroid, adult retina, foetal carcinoma, adult blood, adult neural, foetal kidney, adult placenta, adult testis, whole embryo, adult uterus, adult tumour, foetal brain, adult thymus, foetal placenta, adult uterus, adult tumour, and adult bladder, cDNA libraries. The polynuclectides and proteins are predicted to have blological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. The polynuclectides can be used as markers for tissues in which the protein is preferentially expressed, as molecular weight arreadment of immune deficiencies and disorders, such as severe combined transment of immune deficiencies and disorders, such as severe combined immunedeficiency (SCID), as well as viral, bacterial, fungal and other infections. These infections include human immunodeficiency virus (HIV), hepatitis, herpesviruses, mycobacteria, Leismania spp, malaria and carchinaria. The proteins can be used to treat autoimmune disorders such as connective tissue disease, multiple sclerosis, systemic lupus crythematosis, rheumatoid arthritis, autoimmune pulmonary inflammatin corrections inclimmune pulmonary inflammatory ed disease. The proteins can also be used to treat allergic conditions, such asthma. AAA1674 represent

rinis sequence represents curva encouling integral minimum integration of (IGER). Consents. An allergic response is initiated by release of IGERB were initially identified in a brain consents, this sequence being a consensus. An allergic response is initiated by release of IGERB were from B lymphocytes. The IGE molecules then bind to the high affinity igE receptor (FoRI) present on mast cells and basophils, which triggers the release of histamine and proteases from cytoplasmic granules and least to the synthesis of effectors of the allergic and inflammatory response, such as prostaglandins, leukotrienes and cytokines. As IGERB binds IGE, it may be administered to stimulate allergic and immune cresponses in patients in whom IGERB is under expressed or inactive and to supplement the patients own production of the protein. IGERB may also be used as an antigen for the production of antibodies and activity. The antibodies may also be used in diagnosis. Antibodies and antagonists of may be administered to downregulate IGERB activity and reduce the potency of inflammatory disorders such as multiple sclerosis, candington as the antibodies and allergic responses. They may be used in this way to treat inflammatory disorders such as multiple sclerosis, categorists may be used to enhance immune responses. This sequence represents cDNA encoding human high affinity immunoglobulin High affinity immunoglobulin E receptor-like protein useful for stimulating allergic and immune responses -Sequence 1670 BP; 481 A; 350 C; 334 G; 501 T; 4 other; Example 5; Fig 1; 29pp; English.

                                                                                                                                                                                                                                                                                                                                                                                               * NOTE: This record contains 163 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* Will be sequenced to completion. In the event that
* the record is updated, the accession number will

                                                                                                                                                                                                                                                                                  Center: Whitehead Institute/ MIT Center for Genome Research Center code: WIBR
                                                                                                             Submitted (01.APR-2000) Whitehead Institute/MIT Center for Research, 320 Charles Street, Cambridge, MA 02141, USA on Aug 18, 2000 this sequence version replaced gi:7382629. All repeats were identified using RepeatMasker: Smit, A.F. A. & Green, P. (1996-1997) http://ftp.genome.washington.edu/RW/RepeatMasker.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                             Web site: http://www-seq.wi.mit.edu

It currently consists of 5 contiss. The true order of the places is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Center clone name: 24_D.1
